

3) Users manual suggests use of “split core” ferrites during installation by a qualified technician. The FCC does not normally allow use of “split core” unless the device is professionally installed and the core is not normally accessible after installation. It is uncertain if the cores are accessible or not given the information in the users manual. Kindly comment if they will be accessible, then some method of making the cores permanent is necessary. This includes appropriate shrink molding or similar methods. **The device was not tested with the ferrite cores installed and it meets FCC requirements without ferrites. Y Soft provides and installs the ferrites in order to reduce emissions.**
